

CHANGE IN THE AIR

The new Daystate T3 Super Leggero compressor is designed for shooters who want to be in control of their own air supply and not rely on dive shops or face the workout of a stirrup pump.

Whilst the T2 compressor remains the best choice for gun clubs and shops that need to fill large capacity tanks, the T3 Super Leggero is 10kgs lighter, making it much more portable, and at £1,900, costs £500 less.

The new T3 shares many of the features of its larger stablemate, such as a large, easy to read pressure gauge to monitor output pressure and a safety switch off function.

In addition, to assist servicing schedules, the T3 Super Leggero has a run time counter. Measuring 650mm x 350mm x 390mm and weighing 29kg, the T3 runs at 91db from either a 110 or 230v power supply, enabling the 1.1KW motor to fill even the largest capacity air rifle in just a few minutes at a rate of 40 litres per minute.

The price of exceptionally good compressors just keeps dropping

DESIGNED SPECIFICALLY

Hawke AirMax 30 WA SF scopes are a range of riflescopes designed specifically for airgun shooting. There are four models, including three zooms and one fixed 10x power. All are based on the 30mm tube size and combine the company's H2 optics with second focal plane reticles. These scopes are braced to handle the heavy recoil produced by spring/piston and gas-ram air rifles.

Each model has wide angle optics with 4 inches of eye relief. The straight 10-power Airmax WA SF 10 x 44 has a field of view of 12 feet at 100 yards.

The Airmax WA SF 4-16 x 50 has a field of view of 30.7-7.7ft. at 100 yards. Likewise, the 6-24 x 50 has a 20.3-5.1ft field of view at 100 yards. The 8-32 x 50 Airmax WA SF model has a field of view of 16.1-4ft at 100 yards.

Like other models in the Airmax line-up, these scopes were developed for air rifles by serious air rifle shooters to bring precise accuracy shot after shot.

Airmax 30 WA SF scopes are built on a one-piece aluminium 30mm chassis. The side focus parallax adjustment that can focus down to 10 yards and have additional side focus wheels supplied in the box.

One change is that the adjustable red-

illumination rheostat is now positioned on the end of the side-focus turret, instead of the ocular bell, making the attachment of night-vision add-ons easier. It features six brightness levels of reticle illumination, with 'off' positions in between. This allows for maximum reticle visibility and versatility in any lighting conditions.

These second focal plane scopes feature Hawke's H2 Optics system with 16-layer fully multi-coated lenses and fast-focus eyebells. Capped target turrets and a high-torque zoom ring are featured on adjustable power models.

The Airmax WA SF scopes all have the AMX IR glass-etched reticle, which is based on a mil-dot reticle, but calibrated specifically for air rifles. The AMX IR reticle has half-mil dot spacing on the lower post that provides additional aiming points as the range opens up.
